

MARY FREE BED AT SPARROW NEUROLOGICAL REHABILITATION OUTCOMES

Mary Free Bed
Rehabilitation

Service Dates: January 1, 2019 through December 31, 2019

RESTORING HOPE AND FREEDOM

Innovation • Compassion • Accountability • Respect • Excellence

Mary Free Bed at Sparrow, mid-Michigan’s regional provider of inpatient rehabilitation, restores hope and freedom to individuals who have sustained neurological injuries as a result of trauma, stroke, tumor, anoxic injury or infection.

In 2019, our experienced team of inpatient clinicians rehabilitated 507 patients with a neurological diagnosis. This report highlights our 2019 outcomes based on the most widely used assessment tool in inpatient rehabilitation, FIM™. The graphs demonstrate how we compare to other similar inpatient rehabilitation programs across the nation.

PATIENT SATISFACTION

Mary Free Bed at Sparrow was recognized by Professional Research Consultants as the top performer in the nation for inpatient rehabilitation units with a 100 percent rating in Overall Quality of Care.

DEFINITIONS:

Onset: The average number of days from the time of the injury or diagnosis to when the patient enters inpatient rehabilitation. The sooner a person begins rehabilitation, the better the outcome.

LOS: Length of stay, or the average number of days the patient stays in the rehabilitation program.

Acute care: Sometimes a patient develops a medical condition that may be unexpected, or in some cases, planned, that results in a return to the acute care hospital.

D/C FIM: FIM (Functional Independence Measure) is a point system that measures how much progress a patient makes during the rehabilitation stay. Functional areas are scored on a scale from 1 (dependent) to 7 (independent) in areas of cognition, communication, mobility (transfers), locomotion, self-care, bowel and bladder. The discharge score is the total of all these functional areas.

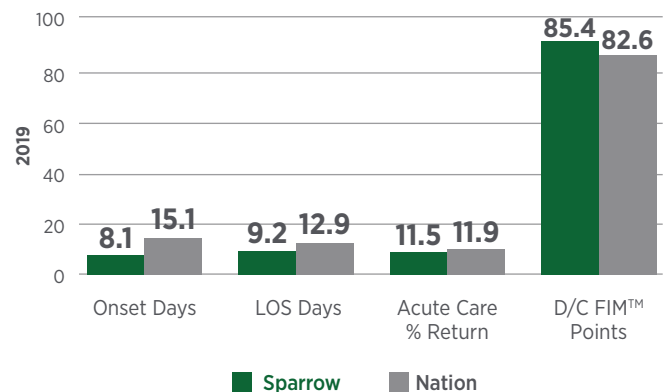

STROKE

Patients Served: 254

TRAUMATIC BRAIN INJURY

Patients Served: 78
