

# MARY FREE BED AT SPARROW REHABILITATION OUTCOMES REPORT

Mary Free Bed  
Rehabilitation

Service Dates: January 1, 2017 through December 31, 2017

## RESTORING HOPE AND FREEDOM

*Innovation • Compassion • Accountability • Respect • Excellence*

Mary Free Bed at Sparrow, mid-Michigan’s regional provider of inpatient rehabilitation, restores hope and freedom to individuals who have sustained neurological injuries as a result of trauma, stroke, tumor, anoxic injury or infection.

In 2017, our experienced team of inpatient clinicians rehabilitated 503 patients with a neurological diagnosis. This report highlights our 2017 outcomes based on the most widely used assessment tool in inpatient rehabilitation, FIM™. The graphs demonstrate how we compare to other similar inpatient rehabilitation programs across the nation.

### DEFINITIONS:

**Onset:** The average number of days from the time of the injury or diagnosis to when the patient enters inpatient rehabilitation. The sooner a person begins rehabilitation, the better the outcome.

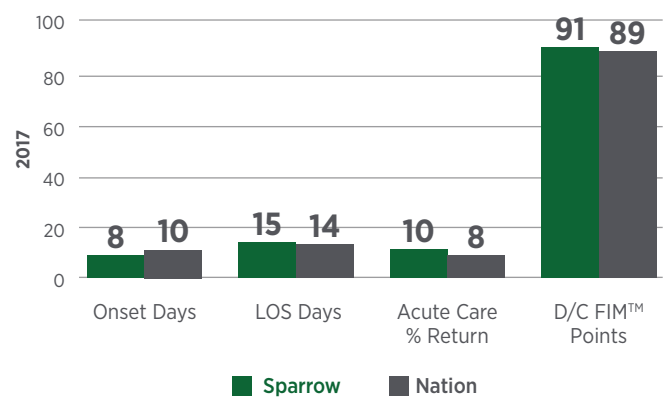

**LOS:** Length of stay, or the average number of days the patient stays in the rehabilitation program.

**Acute care:** Sometimes a patient develops a medical condition that may be unexpected, or in some cases, planned, that results in a return to the acute care hospital.

**D/C FIM:** FIM (Functional Independence Measure) is a point system that measures how much progress a patient makes during the rehabilitation stay. Functional areas are scored on a scale from 1 (dependent) to 7 (independent) in areas of cognition, communication, mobility (transfers), locomotion, self-care, bowel and bladder. The discharge score is the total of all these functional areas.

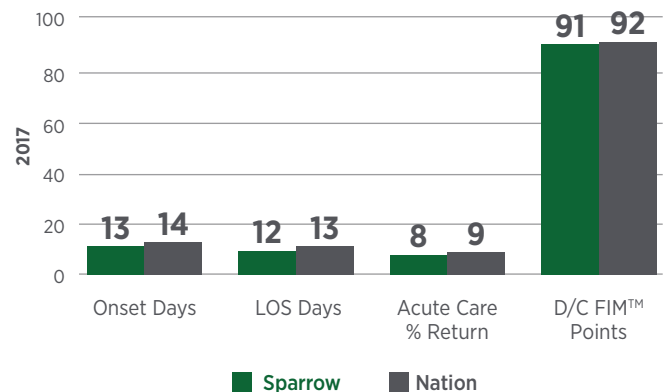

## STROKE

Patients Served: 268

## TRAUMATIC BRAIN INJURY

Patients Served: 53
